

Gulf of Mexico Harmful Algal Bloom Bulletin

Region: Texas

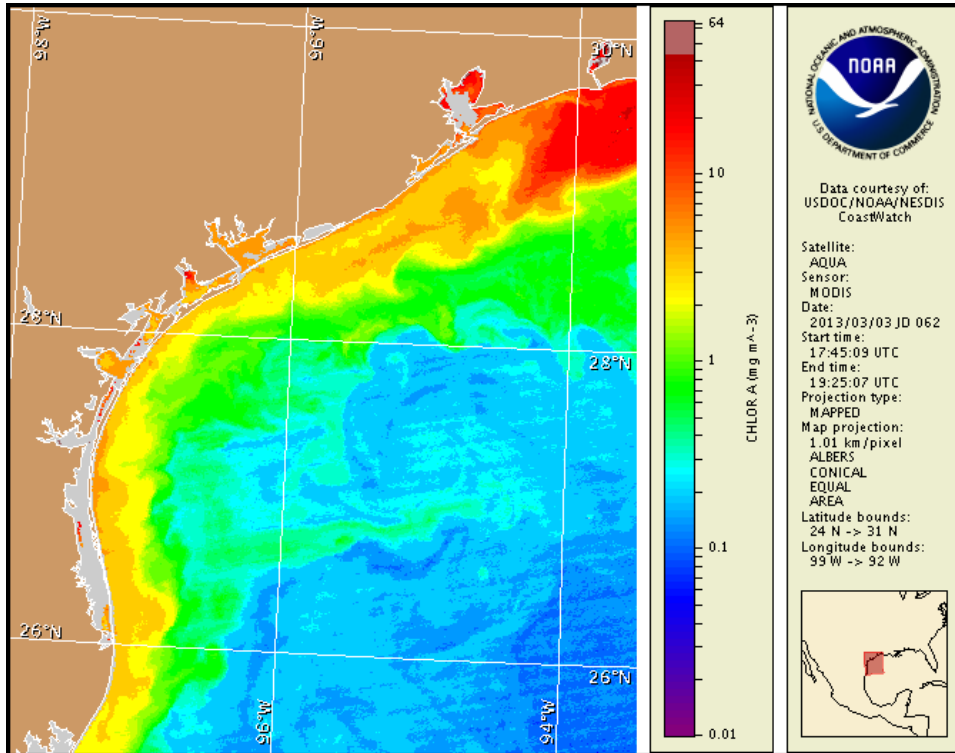

Monday, 04 March 2013

NOAA National Ocean Service

NOAA Satellite and Information Service

NOAA National Weather Service

Last bulletin: Monday, February 25, 2013

Satellite chlorophyll image with possible *K. brevis* HAB areas shown by red polygon(s). Cell concentration sampling data from February 22 to March 1 shown as red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Detailed sample information can be obtained through the Texas Parks and Wildlife Department at:

Conditions Report

There is currently no indication of a harmful algal bloom of *Karenia brevis* (commonly known as Texas red tide) at the coast in Texas. No respiratory impacts are expected alongshore Texas today through Monday, March 11. For information on area shellfish restrictions, contact the Texas Department of State Health Services.

Analysis

There is currently no indication of a harmful algal bloom of *Karenia brevis* at the coast in Texas. In recent MODIS imagery from 3/3 (shown left), elevated to high chlorophyll (2-20 $\mu\text{g/L}$) is visible along- and offshore from Sabine Pass to Bolivar Roads Pass, with elevated chlorophyll (2-4 $\mu\text{g/L}$) visible stretching along- and offshore from Bolivar Roads Pass to the Rio Grande. Elevated chlorophyll is not indicative of the presence of *K. brevis* and is most likely due to the resuspension of benthic chlorophyll and sediments along the coast.

Forecast models based on predicted near-surface currents indicate a potential maximum transport of 50 km north from the Port Aransas region from March 3-7.

Derner, Davis

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA's National Weather Service (NWS).

Wind Analysis

Port Aransas: South winds (20-25kn, 10-13m/s) today. North winds (15-35kn, 8-18m/s) Tuesday. Northeast winds (20-25kn) Wednesday, decreasing (10-15kn, 5-8m/s) Wednesday afternoon. East winds (5-10kn, 3-5m/s) Wednesday night. Southeast winds (10-20kn, 5-10m/s) Thursday and Friday.

Satellite chlorophyll image and forecast winds for March 5, 2013 12Z with cell concentration sampling data from February 22 to March 1 shown as red (high), orange (medium), yellow (low b), brown (low a), blue(very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
